

Renewal stabilization is deployed with every external effect under human control

Eleven scoped changes now form one evidence-backed renewal journey. Normal work is available; live system-of-record proofs remain exact, bounded, and separately authorized.

PRODUCTION

Live | 11 Spaces | exact release at 100% traffic

No RentVine write, operating-Sheet write, or client message occurred in this release.

Eleven scoped changes now work as one controlled renewal journey

Each suite remains independently testable, but downstream work consumes explicit outputs instead of recreating truth.

Outcome: one path from lease truth to human-reviewed work - without turning workflow progress into provider authority.

Operators now see the right work, the evidence behind it, and the next safe action

The canonical Renewal Desk and lease workspace share identity, progress, follow-up, conflict, retention, and role truth.

1 Find the right lease

- Current-month through 120-day cohort
- Tracked incomplete work stays visible
- Search tenant, owner, property, address, or exact lease id
- Deterministic filters, sorts, nulls, and tie-breaking
- No guessed person or adjacent-row identity

2 Know what is true

- Fresh RentVine and Sheet source state
- Contractual base rent stays distinct
- Conflict dispositions preserve exact source identity
- RentCast policy, query, cache, quota, and comp evidence are visible
- Missing or stale evidence says Needs Verification

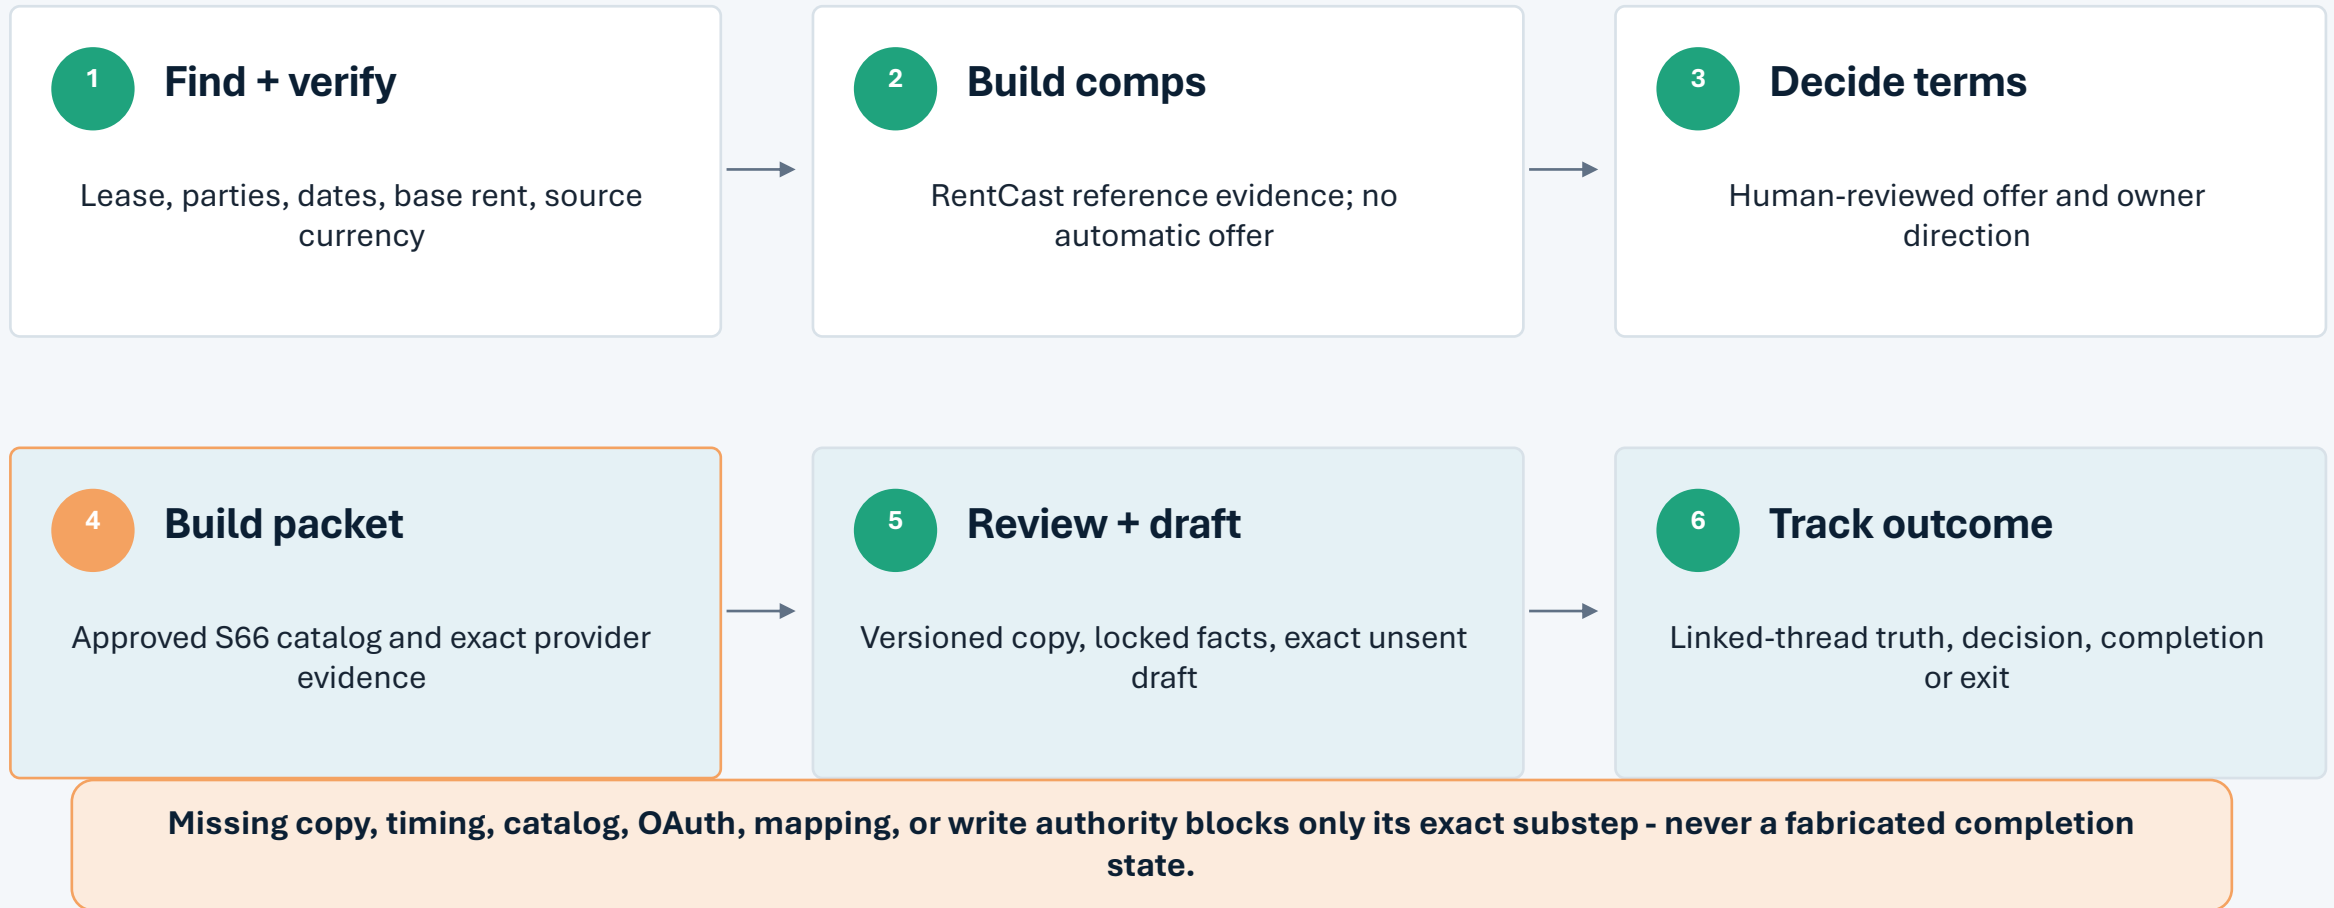

3 Take the safe next step

- Six-step progress uses exact evidence
- Waiting party and last contact come from linked-thread reads
- Unset timing creates no due work
- Role and provider action are checked separately
- Blockers explain the next safe action

One canonical worklist • one source-backed workspace • no sample-data story in Production

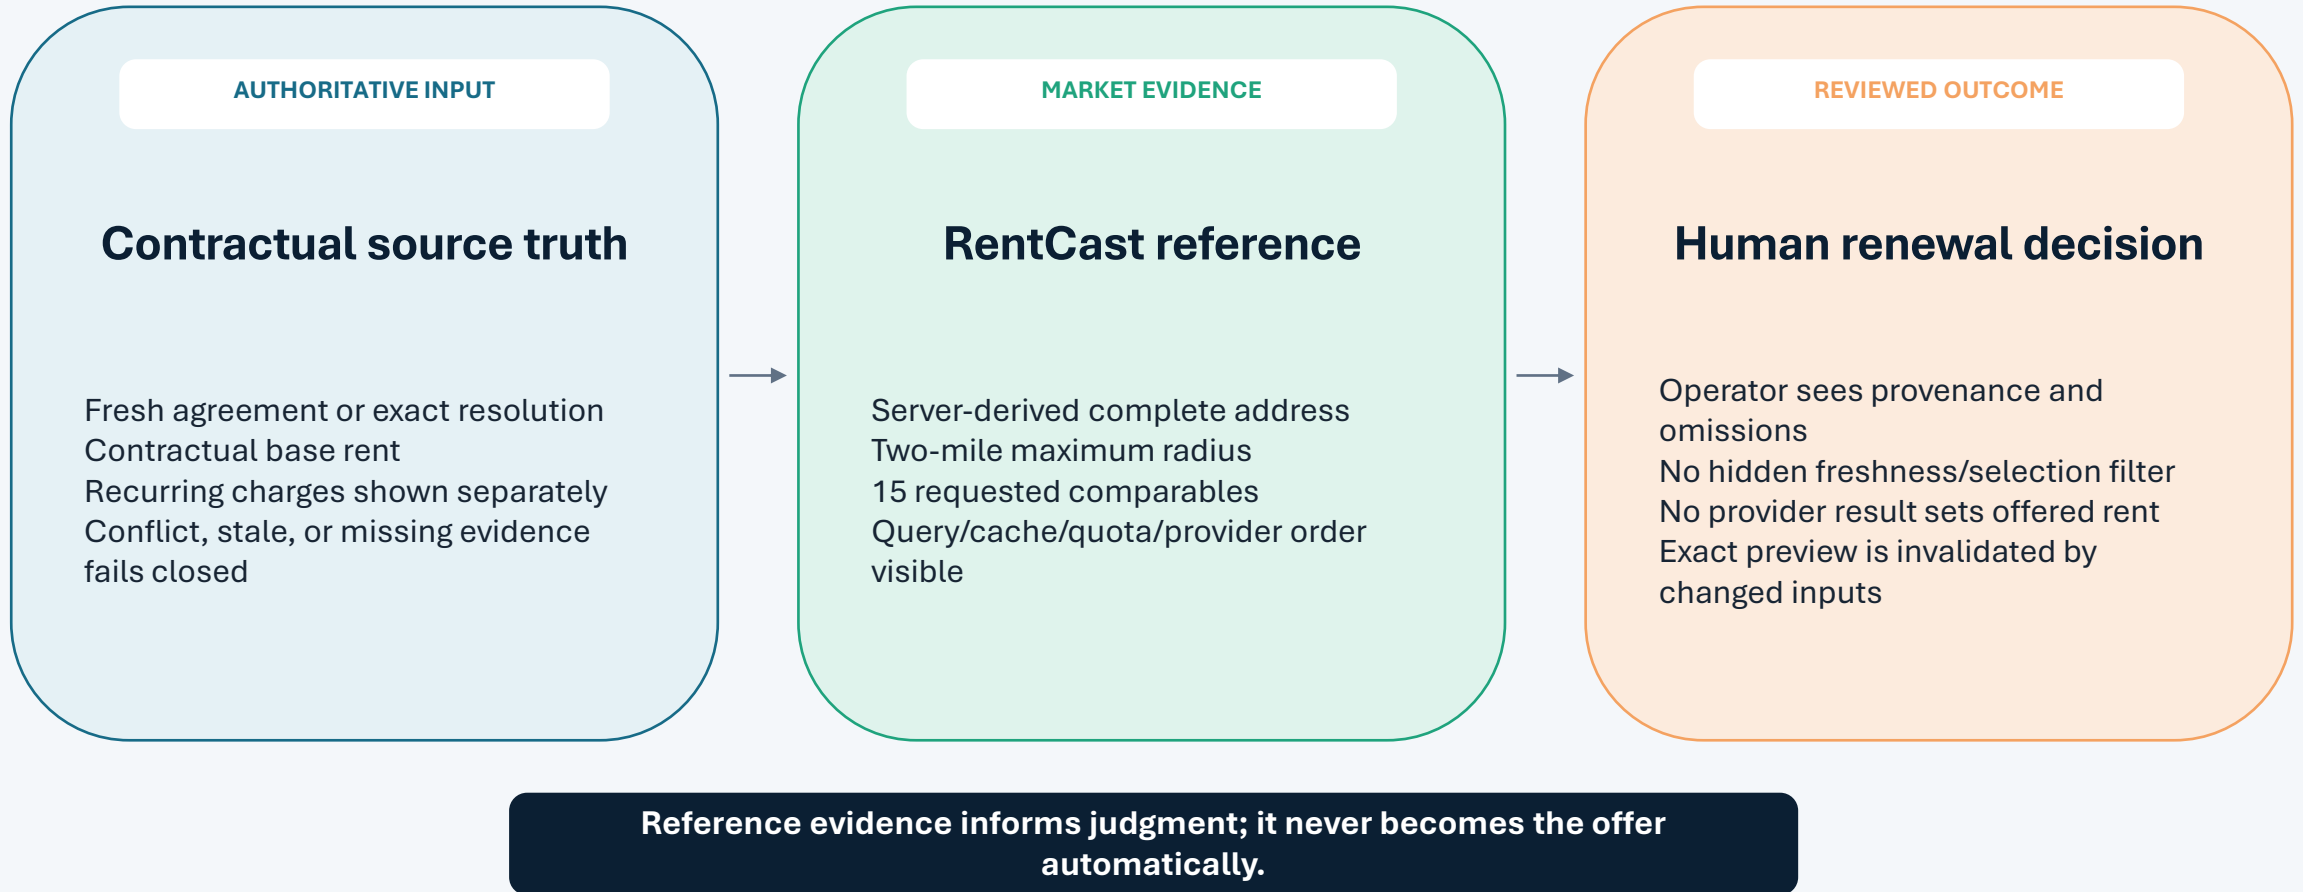

The six-step workflow stays honest because evidence - not clicks - moves work forward

Each step owns operational substeps, roles, completion evidence, blockers, branches, and deterministic reopening.

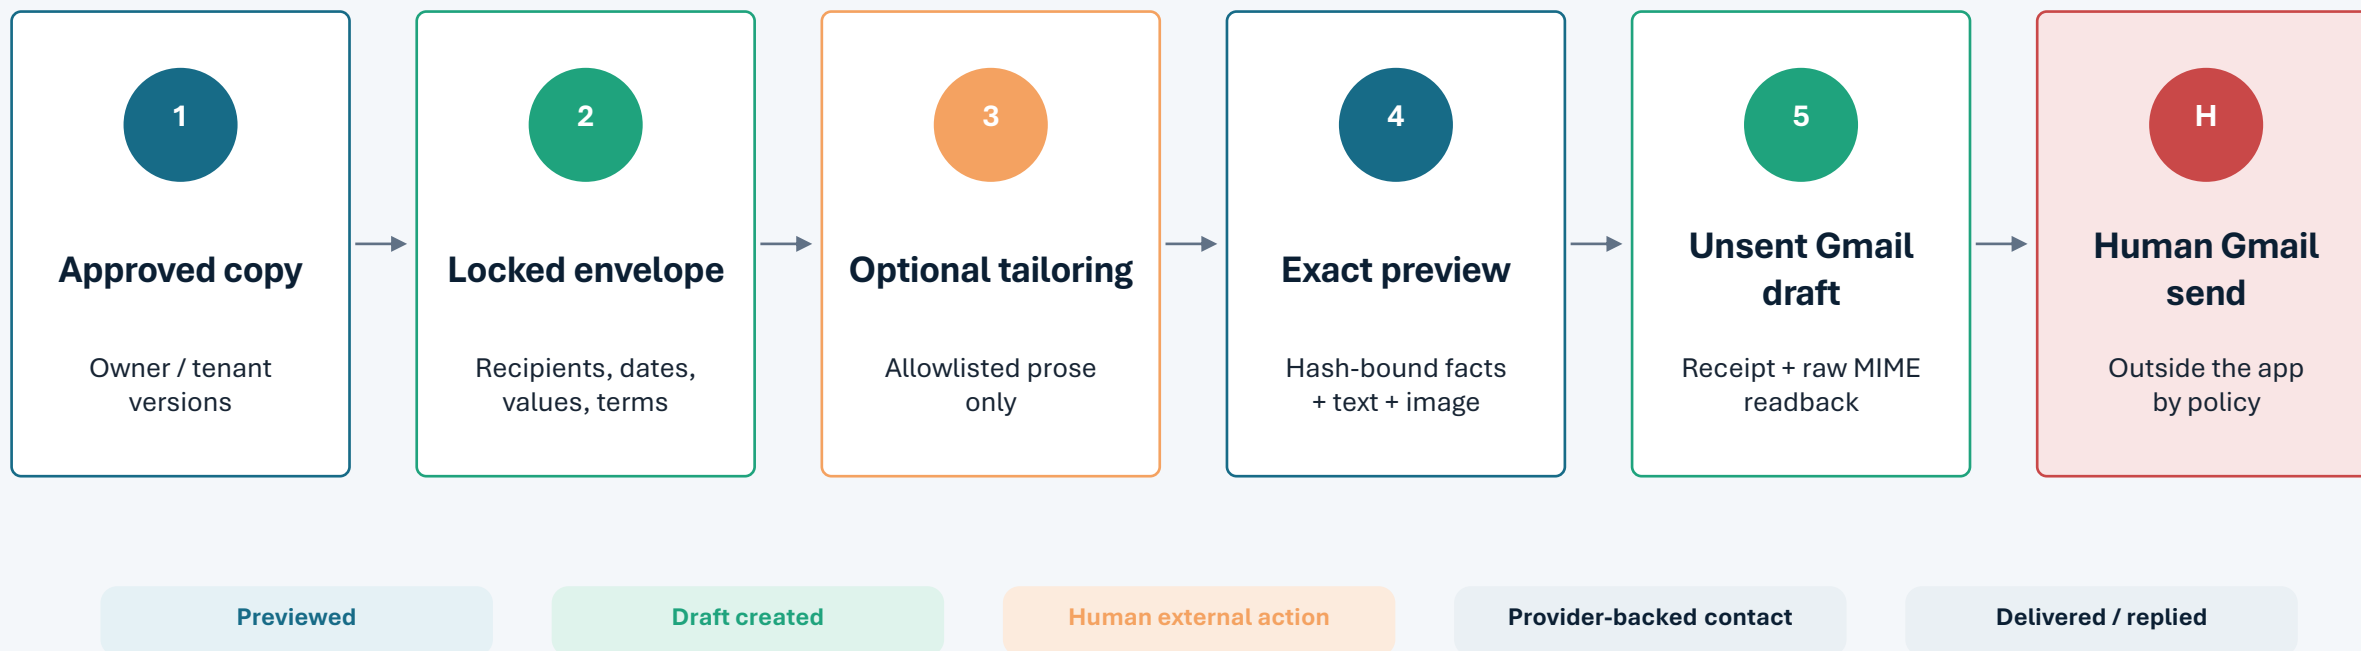

Rent decisions now separate contractual facts, market reference, and human judgment

The system explains the evidence path without converting a provider result into an offer.

Communication is reviewable end to end - and still ends with a human send

Versioned copy, locked facts, exact confirmation, one-attempt recovery, and honest channel states prevent a draft from masquerading as contact.

A Gmail draft is never labeled sent, delivered, contacted, or replied. Continuous watch and autonomous follow-up remain retired.

Roles and exact action keys are independent, so access never implies authority

The same matrix governs pages, API methods, and rendered controls; provider state is checked again at effect time.

Role	App-owned work	Reconcile	Admin config	Provider effect
Editor	Ordinary renewal work	No	No	Exact open key + confirmation
Approver	Ordinary work + reconciliation	Yes	No	Exact open key + confirmation
Admin	Ordinary work + governed config	Yes	Yes	Still needs exact open key

7 open / 34 closed

Exact Registry keys - never a category grant

Writes stay separate

RentVine + operating Sheet remain closed

Sends stay human

Direct client-send keys remain closed

The release evidence is strong - and explicitly excludes unperformed live proofs

Code, policy, store, build, CI, candidate, configuration, promotion, stable readback, and effect boundaries were all checked.

Exact-SHA CI	33330420327	PASS
Zero-traffic candidate	exact commit + revision	PASS
Runtime parity	only image + commit identity differed	PASS
Stable production	exact revision at 100%	PASS
S30 action readback	non-executable after promotion	PASS

Transparent caveat: the complete development tree reports six advisories; the production dependency audit is zero.

Two bounded proofs need customer inputs; neither blocks normal renewal work

The machinery is deployed. Missing external evidence remains visible instead of being guessed or model-filled.

S63 - four-case read-only evidence

Delivered

Secure exact-four capture, immutable baselines, append-only evidence, and separate process / number / safety verdicts.

Needed from customer

Secure runtime + observation packets and a real reviewer.

Safe result

No source write, draft, send, or model-filled human verdict.

S30 - one-lease endDate proof

Delivered

Secure managed-actor, fresh-state, one-attempt forward/rollback/readback/closeout runner behind a closed exact key.

Needed from owner

Exact lease/date packet plus separate protected one-key direction.

Safe result

No recurring-charge proof, second record, blind retry, or general authority.

Separate client decisions still needed: approved owner/tenant copy • timing/override policy • distinct rehearsal Sheet • S66/Dotloop catalog + mappings

The next meeting can close acceptance in one controlled session

Use the evidence already deployed, record real human observations, and keep every external effect separately authorized.

1

Verify production identity

Open /api/version and confirm the exact serving commit/revision.

2

Walk the renewal journey

Desk -> six-step workspace -> evidence -> preview -> unsent draft states.

3

Run the consolidated litmus

Record dated PASS/FAIL observations; repair every genuine failure.

4

Provide proof inputs

Supply secure S63 packets and decide whether to review the separate S30 key.

5

Record policy decisions

Approve copy/channel rules, timing/override policy, and next provider inputs.

Decision requested: confirm the acceptance session and name the secure owners for S63 evidence and any future S30 proof.
