

Wednesday: walk the renewal process

Date: Wednesday afternoon, 9 September 2026. Time and attendees to confirm. **Meeting source:** User-supplied meeting identity; not Calendar-verified.

Goal: everyone can find a lease, follow its next step, recognize a blocker and know who will remove it. Leave with a named owner and agreed date for each next action.

Summary: the core app is live. Improvements await release checks. The full journey still has message-evidence and document-completion gaps.

Proposed 45-minute agenda

Time	Show or discuss	Leave with
0-5 min	What we did: show the delivery readout.	What is live and what is pending.
5-25 min	What we do today: an operator follows the visual guide on any real lease.	Last verified step and confusing clicks.
25-35 min	What is blocked: review the missing-input sheet.	A person, exact handoff and date per blocker.
35-42 min	What comes next: choose fixes and acceptance checks.	An ordered work list; no guessed delivery dates.
42-45 min	Read back decisions and the next review date.	Everyone knows their next action.

Walkthrough

Pick a lease, check the facts, get the owner's decision, prepare the tenant offer, record the reply, and trace documents through signatures and completion. Stop wherever evidence is missing.

Use the [training guide](#). Have a renewal operator drive and an Admin available. Josiah facilitates; these are requested roles, not confirmed attendees. Keep the demo to reading while release or workflow gates remain open. Explain later stages using the diagram. A real change needs the actual lease's normal approvals.

Open questions

- Who supplies approved renewal forms and approves their fields and signers?
- Who owns Dotloop setup and the next provider follow-up?
- Who verifies the next completed walkthrough, and when can we reconvene?

If time remains, confirm maintenance inputs and the two working defaults on the [blocker sheet](#).

Recommended posture: show the real stopping point, agree the smallest next action, and keep unavailable steps visibly open.

Confidence and gaps: labels match current code. The newer build is not the main app. Sign-in requires renewal; no fresh managed-browser pass is claimed. The full journey and throughput remain unproven. Start with the [readout](#).

What we did, what we show, what comes next

Meeting source: User-supplied meeting identity; not Calendar-verified. Wednesday, 9 September 2026.

What we did

- **Live:** the renewal desk, source-backed review, owner terms, reviewed unsent Gmail drafts, controlled source changes, access requests and grouped navigation.
- **Built and pushed:** clearer evidence, term and response handling, safer source changes, release recovery and readiness corrections. Automated checks passed. The newer build is deployed as a candidate, awaiting sign-in and release verification.
- **Prepared for today:** reusable visual training guide, simple agenda, blocker sheet and this readout. The old guide's nonexistent completion click and missing tenant-response step are corrected.

What we show today

Let an operator open any lease, check facts and explain the next action using the [guide](#). Use reading and explanation while release checks remain open. Trace the full process, including waiting, counteroffers, non-renewal, signatures and completion. Log where the real lease stops.

Current limit: a complete, repeatable live renewal is unproven. Sign-in needs renewal; five live-source browser checks remain failed or incomplete. The owner-message evidence handoff and document-to-completion path have gaps. Forms and Dotloop setup alone will not finish that work.

What comes next

Order	Work	How we know it is done
1	Restore sign-in and finish release/browser checks.	Intended build accepted; actual navigation passes; authentication longevity verified.
2	Connect owner-message and completion evidence steps.	A new lease reaches each next stage through visible controls and verified evidence.
3	Finish approved forms, Dotloop setup and packet/signature handoffs.	Correct packet, participants and signed files are read back.
4	Run the guide with a new operator and varied real leases.	Each applicable path completes or stops for an explained reason; measure time and failures.

Assign names and dates using the [blocker sheet](#). Suggested owners are not yet commitments.

Acceptance for repeatable work

Use the same sequence each time. Include acceptance, counteroffer, waiting, non-renewal, missing source evidence and uncertain results when those real cases arise. Record time, errors, repeated clicks and the last verified step privately. Set a throughput target with the client after measuring a baseline; no rate has been demonstrated.

A finished renewal needs the actual signed packet and all applicable completion evidence. A test run, draft, upload or status label alone does not establish completion. Technical evidence: control review.

What is blocking us, and what we need

Meeting source: User-supplied meeting identity; not Calendar-verified. Wednesday, 9 September 2026. Suggested owners are roles to assign. Names and dates are not yet commitments.

Renewal blockers

Blocker	Impact / guide step	Next action and suggested owner	Resume when
Release and browser checks pending	Reliable use of newer flow	Josiah: restore sign-in, finish release checks and resolve slow/failed navigation.	Intended build and actual browser journey pass.
Owner-message evidence not fully connected	Owner response; step 3	Implementation owner: connect the real sent message to the response step.	A sent owner message enables the response with current verified evidence.
Dotloop access and setup incomplete	Packet and signature handoff; steps 7-8	Josiah/provider: obtain OAuth credentials. Account owner: connect and select office profile, renewal template, transaction type and initial status.	Setup reads ready and packet actions pass their separate checks.
Approved forms and mappings missing	Correct documents and signers; step 7	Client forms owner: approved private source, version, applicability and field/signer mappings.	Required forms resolve to approved content and verified participants.
Packet-to-completion click path unfinished	Verified finish; steps 7-9	Implementation owner: finish preview/confirmation, provider evidence, signature return and completion controls.	Real signed artifacts pass applicable completion checks.

Forms to cover: standard lease, renewal extension, animal agreement, lead-based-paint disclosure, city addendum, HOA artifact and owner acknowledgment. Approved rules determine which apply to each lease; do not assume every lease needs every form.

Side work and working defaults

Item	Needed from whom	Scope
Resident-reply draft	Maintenance operator: one real work order with resident chat and verified resident email, privately.	Blocks resident-reply and its dependent pilot, not every renewal.
Property preapprovals	Policy owner: property identifiers, amount per property and effective dates. Admin verifies and confirms.	Blocks that maintenance routing proof, not the renewal guide.
Monthly renewal list	Client decision if a change is wanted.	Default: lease-end-month results separate from periodic reviews.
Annual review date	Client decision if a change is wanted.	Default: next anniversary on or after the current month.

Keep side work out of the main walkthrough unless the client wants to decide it today.

How to communicate a blocker

Use five facts: **where we stopped, what is missing, its impact, who supplies it, and what lets us resume.** Record this in the approved private work record:

We stopped at [step]. The app showed [message]. We need [item] from [person] by [date]. Until then, [action] cannot proceed. We will resume at [step] after checking [evidence].

For example: "Packet creation is waiting on approved renewal forms and signer/field mappings. Please provide the private approved source and version. We can resume packet verification once those mappings are checked." This is prepared wording; no message has been sent.

Leave with this record

Decision or missing item	Named owner	Agreed date	Private evidence location	Resume step and check
Assign during the meeting	To agree	To agree	To agree	To agree

Close an item after its evidence is checked. A promise alone does not close it. Internal gates and identifiers: blocker register.
